Task 7: Business Insights & Recommendations

Business Insights

Insight 1: Electronics Is the Highest-Performing Product Category

The analysis showed that Electronics was the highest-performing product category, generating total sales of ₹233,500.

The other recorded category sales were:

Category	Sales Amount
Electronics	₹233,500
Furniture	₹43,600
Accessories	₹24,850
Stationery	₹4,600
Unknown	₹2,200

Electronics contributed approximately 75.6% of total recorded sales of ₹308,750. This indicates that electronic products were the main revenue contributors in the selected dataset.

Business insight: Electronics was the strongest category by sales revenue, while Stationery recorded substantially lower sales.

Business implication: The business could investigate the reasons for the strong performance of Electronics and evaluate opportunities to maintain its sales while improving the performance of other categories.

Insight 2: The South Region Recorded the Highest Sales

The regional analysis showed that the South region generated the highest sales, amounting to ₹131,900.

The regional sales distribution was:

Region	Sales Amount
South	₹131,900
North	₹81,550
West	₹64,250
East	₹26,250
Unknown	₹4,800

The South region contributed approximately 42.7% of total recorded sales. The East region recorded the lowest sales among the named regions.

Business insight: The South region was the strongest geographical contributor to sales, while the East region had comparatively lower sales.

Business implication: The business could examine successful sales practices in the South region and investigate whether similar approaches could improve performance in the East region.

Insight 3: Laptop Was the Top-Performing Product

The product-level analysis identified the Laptop as the highest-performing product, generating ₹110,000 in sales.

The leading products included:

Product	Sales Amount
Laptop	₹110,000
Monitor	₹50,000
Printer	₹43,500
Office Chair	₹18,600
Desk	₹17,000

The Laptop generated approximately 35.6% of total recorded sales. The Monitor and Printer were also important contributors to revenue.

Business insight: A small group of products, particularly Laptops, Monitors, and Printers, contributed a substantial portion of total sales.

Business implication: These products may deserve particular attention when planning inventory, promotional campaigns, and product availability. However, profit margins and inventory costs should also be considered before prioritizing them.

Insight 4: Monthly Sales Varied Between January and February

The monthly sales analysis showed the following results:

Month	Recorded Sales
January 2026	₹266,500
February 2026	₹42,250

January accounted for approximately 86.3% of the total recorded sales, while February accounted for approximately 13.7%.

However, the dataset contains fewer recorded days in February than in January. Therefore, the difference in monthly totals does not necessarily indicate a decline in business performance.

Business insight: Recorded sales were higher in January than in February, but the available data covers different numbers of days in the two months.

Business implication: The business should compare complete months or equivalent date ranges before concluding that sales are declining. Collecting additional sales data would make trend analysis more reliable.

Insight 5: Total Sales and Order Volume Provide Different Information

The Power BI dashboard included KPI cards for Total Sales, Total Orders, and Total Quantity Sold.

The analysis recorded total sales of ₹308,750 across 39 distinct orders.

Total Sales measures the monetary value of sales, whereas Total Orders measures the number of unique orders. Total Quantity Sold measures the number of product units purchased.

These metrics describe different aspects of business performance. For example, a business may generate high revenue from a relatively small number of expensive products or from a large number of lower-priced products.

Business insight: Evaluating revenue alone does not provide a complete understanding of sales performance.

Business implication: The business should monitor revenue, order count, and quantity sold together to understand changes in customer purchasing activity and sales volume.

Insight 6: Sales Performance Differs Across Categories and Regions

The category and regional analyses revealed differences in sales contributions.

Electronics was the leading category, while Stationery recorded the lowest sales among the named categories. Similarly, South recorded the highest sales among the named regions, while East recorded the lowest.

These differences indicate that sales performance was not evenly distributed across the available categories and regions.

Business insight: Certain categories and geographical regions contributed more revenue than others.

Business implication: The business should investigate whether these differences are associated with customer demand, product availability, pricing, marketing activities, or other factors. The current dataset identifies the differences but does not establish their causes.

Insight 7: Some Records Require Further Data Validation

The analysis included an Unknown category with sales of ₹2,200 and an Unknown region with sales of ₹4,800.

These values indicate that some records may contain missing or unavailable category and regional information.

Although the records can still contribute to the overall sales calculation, missing classifications reduce the accuracy of category-level and regional-level analysis.

Business insight: Incomplete category or region information limits the ability to classify and interpret all sales records accurately.

Business implication: The business should review these records and correct missing classifications wherever reliable information is available. This would improve the quality of future reports and business decisions.

Important Trends and Patterns

Category concentration: Electronics accounted for approximately 75.6% of total recorded sales, making it the leading category by revenue.

Regional concentration: The South region contributed approximately 42.7% of total recorded sales, showing its importance to the overall sales result.

Product concentration: Laptop sales accounted for approximately 35.6% of total recorded revenue. The Monitor and Printer were also important contributors.

Variation in monthly totals: January recorded higher sales than February, but the unequal date coverage means the totals should not be treated as a fair comparison of complete months.

Different measures of performance: Total Sales, Total Orders, and Total Quantity Sold provide complementary information about revenue, purchasing activity, and sales volume.

Incomplete classifications: The presence of Unknown category and region values indicates an opportunity to improve data quality.

High- and Low-Performing Areas

High-Performing Areas

Electronics: This category generated ₹233,500 in sales and was the leading category by revenue.

South region: This region generated ₹131,900, making it the strongest named region in the dataset.

Laptop: The Laptop generated ₹110,000, making it the top-performing product by sales amount.

Monitor and Printer: These products generated ₹50,000 and ₹43,500, respectively, making them other important contributors to total sales.

Low-Performing Areas

Stationery: This category recorded ₹4,600 in sales, the lowest amount among the named categories.

East region: This region recorded ₹26,250, the lowest sales amount among the named regions.

Missing classifications: The Unknown category and Unknown region values show that some records need further validation.

Data-Driven Business Recommendations

Strengthen the Sales Strategy for High-Performing Products

The business should prioritize monitoring demand and product availability for high-performing products such as Laptops, Monitors, and Printers.

Since the Laptop generated ₹110,000 in recorded sales, the business could evaluate opportunities to improve product availability, provide suitable product bundles, and develop targeted promotional campaigns.

Expected benefit: Better product availability and targeted promotions may help maintain or increase sales revenue.

Measurement: Monitor product-level sales, quantities sold, stock availability, and profit margins before and after implementing the strategy.

Improve Sales Performance in the East Region

The East region recorded ₹26,250 in sales, which was lower than the other named regions.

The business should investigate possible reasons for this difference, including customer demand, product availability, pricing, distribution, and marketing activities.

If further investigation identifies an opportunity, the business could test targeted promotions, improve product availability, or strengthen regional marketing.

Expected benefit: A targeted approach may help increase sales in the East region and improve regional performance.

Measurement: Compare sales revenue, order count, and quantity sold in the East region before and after the changes, using comparable date ranges.

Investigate the Performance of Lower-Selling Categories

Stationery recorded ₹4,600 in sales, which was the lowest among the named categories.

The business should investigate whether lower sales are related to limited product availability, weak demand, pricing, or insufficient promotion.

If customer demand supports it, the business could test suitable product bundles, targeted offers, or improved product visibility.

Expected benefit: These actions may help improve sales in lower-performing categories without unnecessarily increasing inventory.

Measurement: Track category-level sales, quantities sold, inventory turnover, and profit margins to evaluate the effectiveness of the changes.

Improve Data Quality

The dataset contained records classified as Unknown for category or region.

The business should review these records and correct missing classifications whenever accurate source information is available. It should also introduce consistent data-entry rules and validation checks to reduce missing values in future records.

Expected benefit: More complete and accurate data would improve reporting reliability and support better business decisions.

Measurement: Monitor the number and percentage of records with missing category or region information in future data updates.

Monitor Sales Trends Using Comparable Periods

The recorded sales totals for January and February were different, but February covered fewer recorded days.

The business should monitor sales using complete months or equivalent date ranges. It should also compare sales revenue, order count, and quantity sold over time.

Once sufficient historical data is available, the business could identify recurring patterns and determine whether sales changes are seasonal or related to other factors.

Expected benefit: Comparable reporting periods would support more reliable trend analysis and reduce the risk of drawing incorrect conclusions from incomplete data.

Measurement: Track sales revenue, order count, and quantity sold across equivalent reporting periods.
